WITH OXYGEN

mostly require heat, 但比 Mg reactive 的 (ie 钾 钠 钙) 不用加热

- eg. $4\text{Na} + \text{O}_2 \rightarrow 2\text{Na}_2\text{O}$
- eg2. $3\text{Fe} + 2\text{O}_2 \rightarrow \text{Fe}_3\text{O}_4$ ← mixture of ① Iron (II) oxide FeO ② Iron (III) oxide Fe₂O₃
- Observable changes
 - > change in colour (metal colour → oxide colour)
 - > change in shininess (metal: shiny → oxide: dull)
 - > flame colour (for Cu, Ca, Na, K, Fe, Mg)

↑ bluish green ↑ brick red ↑ golden yellow ↑ lime ↑ yellow sparks ↑ bright white

WITH NON-METAL ELEMENTS

- 不 reactive 的 (eg. N₂) 要加热
- 注意 non-metal 通常是两颗 atom 组成一个 molecule
- $6\text{Na} + \text{N}_2 \xrightarrow{\Delta} 2\text{Na}_3\text{N}$
- $2\text{Na} + \text{Cl}_2 \rightarrow 2\text{NaCl}$

N₂ 有 triple bond → unreactive

WITH WATER & ACIDS

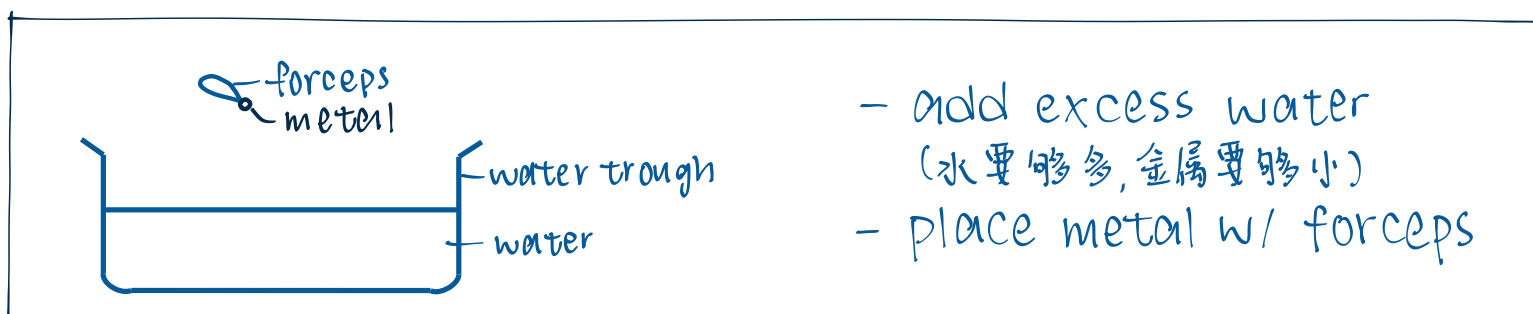

a. liquid water

假设 metal 的 ion 是 1+

- K Na Ca Mg Al Zn Fe ...

✓ react at room temp. ✓ react (hot water) ✗ react

- observable changes
 - > <metal> dissolves
 - > insoluble salt: <colour> solid deposits
 - > soluble salt + coloured ion: solution changes from colourless to <colour>
 - > colourless gas bubbles evolve

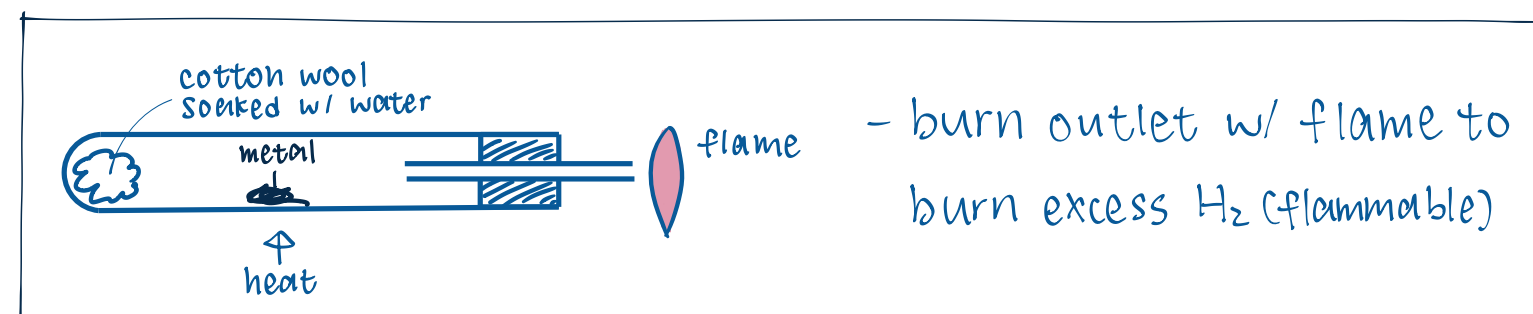

metal 和 hydroxide 的颜色必须不同

b. water vapour

- K Na Ca Mg Al Zn Fe, Sn Pb Cu ...

✓ react ✗ react

- observable changes
 - > change in colour (metal colour → oxide colour)
 - > change in shininess (metal: shiny → oxide: dull)

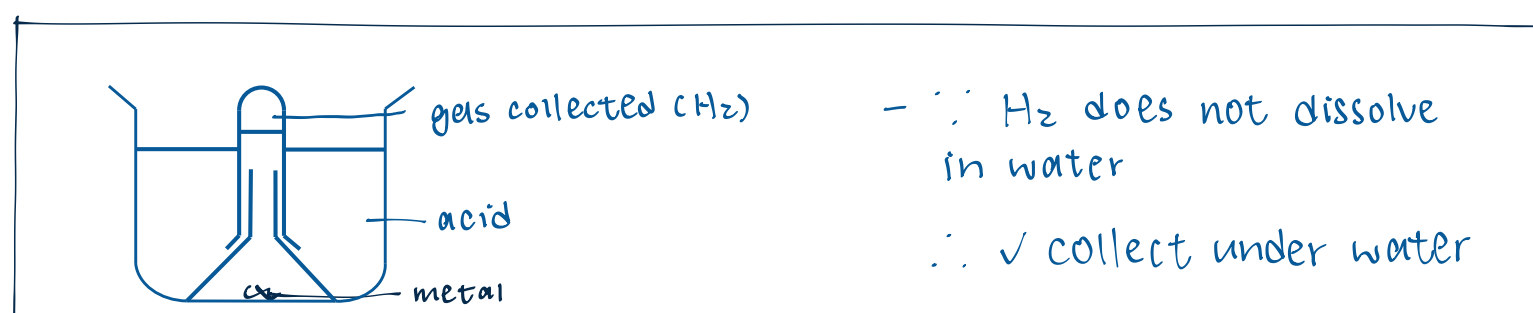

c. acids

acid — dilute/conc. HCl
— dilute H₂SO₄
— very dilute HNO₃
— CH₃COOH
(for rxn of metal & other acids see Acid and Bases topic)

- K Na Ca Mg Al Zn Fe Sn Pb, Cu Hg Ag Au

✓ react ✗ react

- observable changes
 - > <metal> dissolves
 - > insoluble salt: <colour> solid deposits
 - > soluble salt + coloured metal ion: solution changes from colourless to <colour>
 - > colourless gas bubbles evolve
