ntroduction to redox reactions

What is a redox reaction?

- oxidation and reduction occuring simultaneously

Reduction (oxidating agents)	Oxidation (reducing agents)	>其中一个条件符合就行
oxidation no# of an atom +	oxidation no# of an atom?	
-0/+14	+0 / - H	
accept e (e in half equ. RHS)	loses e ⁻ (e ⁻ in holf equ. LHS)	\rightarrow R.A. $\xrightarrow{e^-}$ O.A.

2 Oxidation number

- (of an element in a compound) imaginery charge / charge an atom would have if it existed as an ion.
- Rules

```
自己一个 ion: charge of ion Nat=+1, CI=-1
   Sum of all atoms in polyatomic ion: charge of ion MnO_4^- = -1 eg. find Mn exidation not x + 4(-2) = -1 x = +7
   sum of all atoms in element: 0 H=0=0
> Oxygen
     → in compound:通常-2 H2O, ClO2
     \rightarrow exceptions \Rightarrow Na<sub>2</sub>O<sub>2</sub>, K<sub>2</sub>O<sub>2</sub>, H<sub>2</sub>O<sub>2</sub>: -1
> Hydrogen
     \rightarrow w/ hon-metal: +1 H<sub>2</sub>0, HC1
     → w/ metal: -1 NorH
> Main grp metal
     \rightarrow in compound: +X (X=group no#) AICI3
> Nitrogen
     → MOLX: +5 }相差=8
               NO3: +5
               NO2: +3
               NO2: +4
                 N: O
         NH3, NH4+: -3
    Sulphur
     → max: +6 } 相差=8
```

- Minimum and maximum O.N.

 $\rightarrow 50_4^{2-}, 50_3: +6$

 $S0_3^{2-}$, $S0_2: +4$

H2S: -2

```
> main group metals \longrightarrow min = max = +\chi (\chi = Grp no#)
   main group non-metals \longrightarrow max = +X (X=Grp no#) min = - (8-X)
   transitional metals \longrightarrow max = †7 min = 0
> original O.N. = min O.N. -> can only + after ra -> R.A.
   original O.N. = max O.N. -> can only & after ra -> O.A.

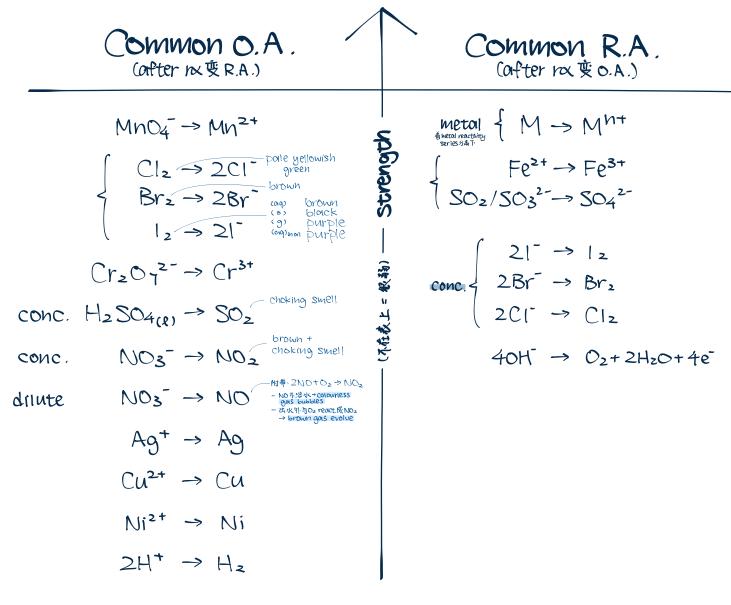

→ if in middle of range → weak

→ requires strong RA. O.A. for range

→ requires strong RA.
   original O.N. in (min O.W., max O.N.) -> can $ / to after rx -> O.A. (R.A.)
```

exclusive range

3 Common O.A.s and R.A.s

SKILLS (MC)

判断 → Rule 5: precipitation rx

... Not redox reaction

>> X redox

4 Identify if reaction is redox

```
1. 有15背Common O.A./R.A. — > ~
 2. 有metal element/non-metal element -> ~
  4. 「变2/2变」 — > ✓
 5. 排除法 (ra为 A-B/ppt) ————> ×
  ANSWERING STRUCTURE (La)
 \sqrt{\text{redox}} - oxidation number of x in x_n Y = \dots
```

```
Oxidation number of \times in \times = product
                 \div there is change in oxidation number of X after reaction
                 : It is redox reaction.
   × redox - There is no change in oxidation number of all atoms before & after reaction.
                  Not redox reaction.
EXAMPLES -
   1. 2Mn04^{2} + 5S0_{3}^{2} + 6H^{+} \longrightarrow 2MN^{2+} + 5S0_{4}^{2} + 3H_{2}O
```

```
判断 -> Rule 1: MnO4-, SOs2-
         → V redox
   作答 → Oxidation number of Mn in MnO4=+7
           Oxidation number of Mn in Mn^{2+} = +2
            There is change in exidation number of Mn
            i. It is redox reaction.
2. Clz + NOOH -> NOCI + NOOCI + H20
    判断→ Rule 2/3: I non-metal element
            Rule 4: C12 → Nac1, Naoc1
         \rightarrow \vee redox
   作皆 → Oxidation number of Cl in Clz = O
            oxidation number of CI in NaCl = -1
            Oxidation number of CI in NaOCI = +1
            There is change in oxidation number of CI
            I. It is redox reaction.
3. Cr_2O_7^{2-} + H_2O \rightleftharpoons 2CrO_4^{2-} + 2H^+
    判断一(其他rule不合用,一定得算)Rule 6
            Cr2072-+ H20 = 2Cr042-+ 2H+
           ○与H的O.N.这变, Cr不可能自己变(除非一变二/=变一)
    作智 -> There is no change in oxidation number of all atoms before & after reaction
            ... Not redox reaction
4. Na2CO3 + 2HC1 -> 2NaC1 + CO2 + H2O
   判断→ Rule 5: Acid-base rx
         \rightarrow \times redox
   作皆 → There is no change in oxidation number of all atoms before & after reaction
            ... Not redox reaction
5. Pb(NO_3)_2 + 2NaCl \rightarrow 2NaNO_3 + PbCl_2
```

作皆 → There is no change in oxidation number of all atoms before & after reaction
