# ntroduction to redox reactions

#### What is a redox reaction?

- oxidation and reduction occuring simultaneously

Reduction (oxidising agents)	Oxidation (reducing agents)	→其中-个条件符合就行
oxidation no# of an atom +	oxidation no# of an atom?	
-O/+H	+0 / - H	
(e-in harf equ. RHS)	(05es e <sup>-</sup> (e <sup>-</sup> in holf equ. LHS)	$\rightarrow$ R.A. $\xrightarrow{e^-}$ O.A.

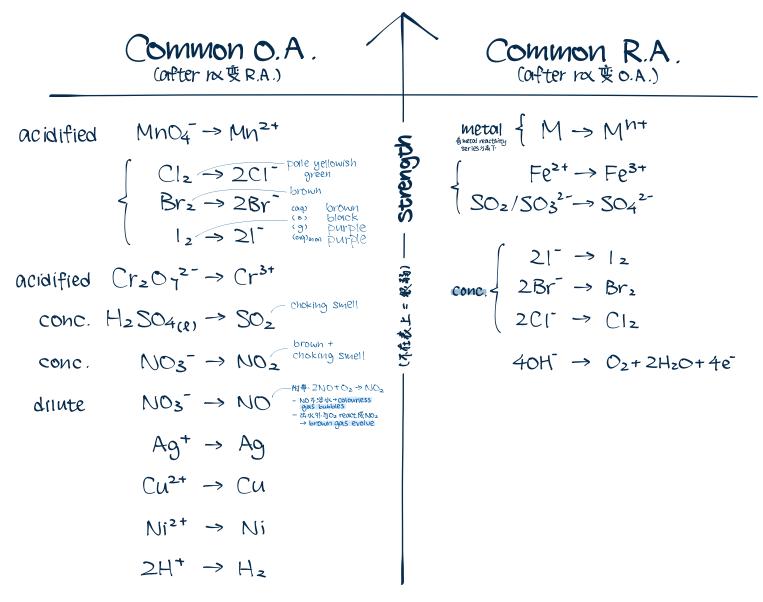

### 2 Oxidation number

- (of an element in a compound) imaginery charge / charge an atom would have if it existed as an ion.
- Rules

```
自己一个 ion: charge of ion Nat=+1, CI=-1
       sum of all atoms in element: 0 H=0=0
       Sum of all artoms in polyatomic ion: charge of ion MnO_4^- = -1 eg. find Mn exidation not x + 4(-2) = -1 x = +7
    > Oxygen
         → in compound:通常-2 H2O, ClO2
         \rightarrow exceptions \Rightarrow Na<sub>2</sub>O<sub>2</sub>, K<sub>2</sub>O<sub>2</sub>, H<sub>2</sub>O<sub>2</sub>: -1
    > Hydrogen
         \rightarrow w/ hon-metal: +1 H<sub>2</sub>0, HC1
         → w/ metal: -1 NorH
    > Main grp metal
         \rightarrow in compound: +X (X=group noff) A|C|<sub>3</sub>
    > Nitrogen
         → MOLX: +5 }相差=8
                   NO3: +5
                   NO2: +3
                   NO2: +4
                     N: O
             NH3, NH4+:-3
        Sulphur
         → max: +6 } 相差=8
         \rightarrow 50_4^{2-}, 50_3:+6
              SO32 , SO2 : +4
                   H2S: -2
- Minimum and maximum O.N.
```

```
> malin group metals \longrightarrow max = +\chi (\chi = Grp no#) min = 0
  main group non-metals \longrightarrow max = +X (X=Grp no#) min = +X - 8
  transitional metals \longrightarrow max = +7
> original O.N. = min O.N. -> can only + after ra -> R.A.
   original O.N. = max O.N. -> can only & after ra -> O.A.
```

## 3 Common O.A.s and R.A.s

original O.N. in (min O.W., max O.W.) -> can P/+ after ra -> O.A./R.A.

## SKILLS (MC)

4 Identify if reaction is redox

```
1. 有咳背Common O.A./R.A. → ✓
  2. 有metal element/non-metal element -> ~
  3. Element = compound ----
  5. 排除法 (ra为A-B/ppt) ————> ×
  ANSWERING STRUCTURE (LQ)
 \sqrt{\text{redox}} - oxidation number of x in x_n Y = \dots
```

```
Oxidation number of X in X = \frac{1}{2}
                 \overline{\phantom{a}} there is change in oxidation number of X after reaction
                 :. It is redox reaction.
   X redox - There is no change in oxidation number of all atoms before & after reaction.
                 Not redox reaction.
EXAMPLES -
```

```
1. 2Mn04^{2} + 5S0_{3}^{2} + 6H^{+} \longrightarrow 2MN^{2+} + 5S0_{4}^{2} + 3H_{2}O
   判断 -> Rule 1: MnO4-, SO32-
         → V redox
   作答 → Oxidation number of Mn in MnO4=+7
            Oxidation number of Mn in Mn^{2+} = +2
            There is change in exidation number of Mn
            : It is redox reaction.
2. Cl2 + NaOH -> NaCI + NaOCI + H2O
    判断→ Rule 2/3: V non-metal element
             Rule 4: C12 → Nac1, Naoc1
         \rightarrow \vee redox
                                                          NaCl → Clz is O.A. → 一样物质同时是O.A., R.A.
   作賞 → Oxidation number of Cl in Clz = O
            oxidation number of CI in Nacl = -1
                                                reason not
            Oxidation number of CI in NaOCI = +1
             there is change in oxidation number of CI
            . It is redox reaction.
3. Cr_2O_7^{2-} + H_2O \rightleftharpoons 2CrO_4^{2-} + 2H^+
    判断一(其他rule不合用,一定得算)Rule 6
            Cr2072-+ H20 = 2Cr042-+ 2H+
            ○与H的O.N. 沒变, Cr不可能自己变(除非一变二/=变一)
    作智 -> There is no change in oxidation number of all atoms before & after reaction
            .. Not redox reaction
4. Na2CO3 + 2HC1 -> 2NaC1 + CO2 + H2O
    判断→ Rule 5: Acid-base ra
         \rightarrow \times redox
   作皆 → There is no change in oxidation number of all atoms before & after reaction
            ... Not redox reaction
5. Pb(NO_3)_2 + 2NaC1 \rightarrow 2NaNO_3 + PbCl_2
   判断 → Rule 5: precipitation rx
         -> X redox
```

作皆 → There is no change in oxidation number of all atoms before & after reaction

... Not redox reaction
